BELL POTTER

Is there value in fixed income?

The combination of a hawkish Federal Reserve and a developing conflict between Russia and Ukraine has elevated commodity prices, recalibrated interest rate expectations and spiralled financial markets.

Given that inflation is mathematically defined as the persistent increase in the price level over time (rate of change), a singular jump does not mean that an economy is experiencing inflation. An increase in the price of a single good/service, or in relative prices of some goods/services, does not signal that inflation is present either. The prices of almost all goods and services must be increasing. We believe that this is unsustainable, particularly as central banks begin to destroy aggregate demand. The forward-looking bond markets have been pricing in aggressive rate hikes, producing a harsh and protracted sell-off as the present value of a bond's payments, or its market value, decrease as bond yields increase. Central banks, especially Australia, have been far behind on yield curve control. Add to this the fact that our wage push is lagging, plus funding costs would increase at a time when the economy sits as highly levered. Investment Grade bonds then begin to look reasonably attractive from a longer-term investment horizon (Continued on page 2).

What the yield curve is pricing in

"We will take the necessary steps to ensure a return to price stability. In particular, if we conclude that it is appropriate to move more aggressively by raising the federal funds rate by more than 25 basis points at a meeting or meetings, we will do so. And if we determine that we need to tighten beyond common measures of neutral and into a more restrictive stance, we will do that as well." - Jay Powell, Federal Reserve Chairman, 21 March 2022.

Market participants are now assuming that a series of larger +50bps rate hikes are highly plausible in the US, as is the running down of the Fed balance sheet. The US market has priced in a higher terminal rate with incremental increases culminating to 2.25% over the next 5 years, with the first 1.25% occurring in the next 6 months. As a result, bond yields have risen sharply, particularly in the shorter end of the yield curve.

"Inflation had picked up and a further increase was expected, with measures of underlying inflation in the March quarter expected to be above 3 per cent. Wages growth had also picked up but, in aggregate terms, had been below rates likely to be consistent with inflation being sustainably at the target. These developments have brought forward the likely timing of the first increase in interest rates. Over coming months, important additional evidence will be available on both inflation and the evolution of labour costs." - Minutes of the April 2022 Monetary Policy Meeting of the Reserve Bank Board.

Despite not having quite the same inflation backdrop as other developed economies, Australian bond yields have largely tracked the rise in yields of larger and deeper markets. The Australian market is pricing in a higher Official Cash Rate of 2.75% over the next 5 years, or more than 1.25% for the next 12 months in total, the equivalent of 10-11 +25bps hikes and 5 +25bps hikes, respectively. The last rate hiking cycle post the Global Financial Crisis (GFC) saw 7 +25bps increases, while the market had priced in as much as +300bps of rate hikes over 2 years during the initial recovery period. This was a differential of +125bps. A similar event could lead to meaningful positive capital returns on fixed income assets.

Figure 6 - Market-implied rate expectations

SOURCE: BETASHARES, BLOOMBERG. AS AT 23 MARCH 2022.

The yield curve, which depicts the yield on interest-bearing securities as a function of their remaining time to maturity has also been changing. 2 and 10 Year US Treasury yields rose by +90bps and +52bps respectively during March, with the 2s/10s curve also briefly inverting for the first time since August 2019, which is commonly a technical lead indicator for recessions. Yields on high-yield bonds increased +32bps and spreads tightened by -40bps during March to 6.31%, meaning that securities then offered only a modest premium for the assumed higher risk of default relative to history.

While many uncertainties still linger, adhering to fundamental asset allocation and keeping to a longer-term risk/return appetite is more suitable for fixed income - where investors should be focused on total returns instead of becoming fixated on the negative short-term impact on bond capital prices. Exiting these investments now would crystallise a loss on one of the sharpest and protracted downward movements in bond markets while also sacrificing the prospect of higher yields.

Higher yields on investment grade bonds today should see the return of higher income as bond coupon payments and cashflows are constantly being reinvested at today's yields.

What is a fixed-income ETF?

Fixed-income Exchange-Traded Funds are like managed funds that contain a portfolio of underlying bonds that are traded intraday on an exchange like equity securities. Most fixed-income ETFs seek to passively track the performance of an index that follows specific segments of the market, such as Government, Investment Grade Corporate, High Yield Corporate or Emerging Market Bonds. Rather than trading individual bonds in the Over-The-Counter (OTC) market, investors can access these same exposures by purchasing a bond ETF on the ASX.

How do fixed-income ETFs work?

Provided that there are no bespoke tailoring rules, an index tracking bond portfolio functions like a rolling group of fixed-income investments held to maturity. Cashflow from the repayment of principal and interest will mean that the composition of the bond portfolio underpinning the ETF changes over time as individual bonds in the portfolio mature. These bonds will be replaced by new entrants with similar characteristics that may pay a higher or lower degree of income, depending on market conditions. This cycling of securities through the portfolio will mean that the Fund matches the index, in turn changing the income received from fixed-interest ETFs over time.

As cash is reinvested at a higher yield, this improves the prospects for total returns.

Bonds are trading at a discount

A bond trading below its face or par value (typically \$100) in the secondary market is said to be trading at a discount. As new bonds issued in the primary market are pegged with a higher coupon, which makes existing issuances relatively less attractive, in turn driving down the price (think supply and demand).

The Yield to Maturity (YTM) is the internal rate of return that would equate the present value of a bond's future cash flows to maturity to its current market price. On the assumption that default risk is low, the securities of favourably rated sovereigns and corporates should be redeemed at \$100. Bond prices will then have an inherent "pull to par" effect as they move towards maturity, with the proceeds being reinvested into higher coupon bonds (as outlined above and assuming that yields do not fall from current levels), which functions much like compound interest.

The asset weighted price of the Bloomberg AusBond Composite 0+ Bond Index was formerly ~\$97. With a large scatter of bonds to mature in the short end where rates have been rapidly rising - this presents an opportunity for total returns while recalibrating the income profile of the composite exposure.

Figure 7 - A look at the pull to par

SOURCE: VANGUARD, BLOOMBERG. AS AT 29 MARCH 2022.

Figure 8 - Options for investors looking at Australian fixed income

Name	Code	Index	Unit Price ¹	Management Costs (p.a.) ²	Holdings ²	Duration ²	YTM ²	Average Credit Quality ²
Vanguard Australian Fixed Interest Index ETF	VAF	Bloomberg AusBond Composite 0+ Yr Index	\$45.25	0.15%	662	5.4 Years [^]	3.01%	AA+
<p>VAF seeks to track the performance of the Bloomberg AusBond Composite 0+ Yr Index, before taking into account fees, expenses and tax. An investment in the Fund provides underlying exposure to high-quality, income-generating securities issued by the Commonwealth Government of Australia, Australian State Government authorities and treasury corporations, investment-grade corporate issuers, as well as overseas entities that issue debt in local denomination. AA+ rated fixed-income securities with an effective duration of 5.4 years appear attractive when considering the time value of money and compounding at higher yields. Much of the Australian landscape has been sold-off despite creditworthiness given the significant yield curve control that is now required of the Reserve Bank of Australia.</p>								
BetaShares Australian Investment Grade Corporate Bond ETF	CRED	Solactive Australian Investment Grade Corporate Bond Select TR Index	\$22.74	0.22%	52	6.3 Years*	5.19%	BBB+
<p>CRED seeks to track the performance of the Bloomberg AusBond Composite 0+ Yr Index, before taking into account fees, expenses and tax. An investment in the Fund provides underlying exposure to Australian Dollar denominated Non-Government investment-grade bonds with a tenor of between 5.25 and 10.25 years and amounts outstanding >\$250m. Constituents are equally weighted and may include bonds from Supranational and Local Authority issuers if there are insufficient corporate bonds, with holdings being selected based on option-adjusted spreads; a measure of the excess rate of a fixed-income security over Treasuries, which is then adjusted to take into account an embedded option. Higher relative credit risk, but still investment grade exposure that harvests significant term premia and credit premia.</p>								
VanEck Australian Floating Rate ETF	FLOT	Bloomberg AusBond Credit FRN 0+ Yr Index	\$24.75	0.22%	178	0.1 Years*	3.26%	A+
<p>FLOT seeks to track the performance of the Bloomberg AusBond Credit FRN 0+ Yr Index, before taking into account fees, expenses and tax. An investment in the Fund provides underlying exposure to Floating Rate Notes (FRNs) that are of investment grade quality, issued by corporate entities such as the four largest banks in Australia, foreign banks, other lending institutions and Australian listed property trusts (A-REITs). FRNs have near-zero interest rate risk due to the embedded periodic coupon reset feature, which is typically on monthly or quarterly basis, and can significantly lower interest rate sensitivity in an investor's portfolio. Yields are pegged to the reference BBSW3m interest rate plus a fixed spread that is determined at the time of issuance based on the market's perception of credit risk. FRNs have the effect of preserving capital value in a rising interest rate environment.</p>								
iShares Government Inflation ETF	ILB	Bloomberg AusBond Inflation Government 0+ Yr Index	\$120.90	0.18%	13	9.9 Years*	3.08%	AAA
<p>ILB seeks to track the performance of the Bloomberg AusBond Inflation Government 0+ Yr Index, before taking into account fees, expenses and tax. An investment in the Fund provides underlying exposure to inflation-linked bonds issued by Australian Government and Semi-Government authorities with a minimum of at least 1 month to maturity and an issue size of A\$50m. These indexed bonds adjust the face value by the quarterly Consumer Price Index (CPI) and the fixed rate interest payment is calculated on the adjusted face value or capital value of the bond. At maturity, investors receive the adjusted face value of the indexed bond plus the final coupon, providing for an insulation as both coupon interest payments and the capital value payable at maturity increase 1:1 in line with changes to the CPI. This to ensures a return that is above the inflation rate and helps to reduce the inflation risk.</p>

SOURCE: BLOOMBERG. DATA AS AT 23 MAY. ¹DISTRIBUTION YIELD IS BASED ON THE SUM OF AMOUNTS THAT HAVE GONE EX-DIVIDEND OVER THE PAST 12 MONTHS.

[^]EFFECTIVE DURATION - AN OPTION ADJUSTED MEASURE OF THE SENSITIVITY OF THE VALUE OF THE PORTFOLIO TO CHANGES IN INTEREST RATES. IT IS USED TO CALCULATE AN APPROXIMATION OF THE MODIFIED DURATION OF A BOND WITH AN EMBEDDED OPTION.

^xMODIFIED DURATION - MEASURES THE SENSITIVITY OF THE VALUE OF THE PORTFOLIO TO CHANGES IN INTEREST RATES. IT FOLLOWS THE CONCEPT THAT INTEREST RATES AND BOND PRICES MOVE IN OPPOSITE DIRECTIONS. A MODIFIED DURATION OF 6 YEARS IMPLIES THAT A 1% INCREASE IN THE INTEREST RATE WILL REDUCE THE VALUE OF THE PORTFOLIO BY 6%; AND VICE-VERSA FOR A DECREASE IN THE INTEREST RATE.

Appendix A: Glossary of terms

Active Management: Investing with the goal of outperforming a benchmark index.

Alpha: A manager's return relative to the return of a benchmark. For example, consider an active manager with the S&P/ASX 200. If the manager returned 5% when the S&P/ASX 200 Index returned 4%, then the alpha would be 1%. Note that alpha can be both positive and negative, shown as outperformance and underperformance, respectively.

Authorised Participant: Large investors, institutions, exchange specialists and arbitrageurs that place orders for creation units with the fund's distributor.

Beta: In the context of this report, beta refers to the sensitivity of in response to swings in the market. A beta of 1 indicates that a fund's unit price return will move in line with a benchmark. Whereas, a beta of greater than 1 indicates that a fund's unit price return will be more volatile than the market, and vice versa.

Credit Rating: Forward-looking opinions about credit risk based on the ability and willingness of an issuer, such as a corporation or government, to meet their financial obligation in full and on time.

Derivative Replication: The process in which a portfolio manager seeks to replicate performance.

Effective Duration: An option adjusted measure of the sensitivity of the value of the portfolio to changes in interest rates. It is used to calculate an approximation of the modified duration of a bond with an embedded option.

Exchange Traded Fund (ETF): Investment vehicles that are constructed in the same nature as a mutual fund, but which trade on a stock exchange. ETFs combine the diversification benefits of mutual funds, with exposure to a wide array of assets in a single trade, and typically track the performance of a broad market index, sector, commodity or theme.

Franking: A tax credit used in Australia that allows domestic companies to pass through taxes that have already been paid on corporate profits. Given the trust structure, ETFs are required to distribute all capital gains, earnings and franking credits to underlying unit holders.

Free-Float: The amount of a company's shares outstanding that are available for purchase on the open market at any point in time.

Full Replication: The process in which a portfolio manager seeks to replicate performance by exactly matching the benchmark in composition and weight to ensure a similar outcome. The ETF will hold 90% or more of the members of the index in this instance.

Grossed-Up Dividend Yield: Dividends paid plus any associated franking credits, if available.

Liquidity: The ability to convert a security or asset quickly into cash.

Management Expense Ratio (MER): Management Fees help to recoup expenses incurred in connection to the operation of the fund (such as administration and accounting costs, registry fees, audit and tax fees and investor reporting expenses), expressed as a proportionate value of the fund. This is calculated daily and deducted from the fund's Net Asset Value. No costs are directly borne by the investor.

Market-Capitalisation: The value of a publicly listed company, calculated as the product of price and units/shares outstanding.

Modified Duration: Measures the sensitivity of the value of the portfolio to changes in interest rates. It follows the concept that interest rates and bond prices move in opposite directions. A modified duration of 6 years implies that a 1% increase in the interest rate will reduce the value of the portfolio by 6%; and vice-versa for a decrease in the interest rate.

Net Asset Value (NAV): The value of the underlying assets of the Fund minus its liabilities, divided by the number of units outstanding. This is typically calculated at the end of each business day.

Optimised Replication: The process in which a portfolio manager seeks to replicate an index by using a representative basket of securities. Optimisation is generally used in markets where liquidity may be limited or costs are prohibitive for full replication. The ETF will hold less than 90% of the members of the index in this instance.

Passive Management: Investing in an attempt to track the return of an underlying benchmark index or asset.

Performance Fee: Fees linked to the value added by a fund manager, calculated on the relative outperformance of the benchmark index or absolute return performance hurdle, often subject to a high watermark mechanism.

Sharpe Ratio: This ratio provides a measure of the return of an ETF's portfolio, relative to the risk taken by the investment manager in achieving those returns. A higher return is only desirable if it does not come with too much additional risk (volatility of returns).

Smart Beta: Strategy with blended components of both Passive and Active Management. It seeks to capitalise on predetermined thematic or rules-based methodologies for investing, attempting to outperform, or have less risk than, traditional broad market cap weighted indices.

Spread: The gap between the highest price that a buyer is willing to pay (bid), and the lowest price for which a seller is willing to sell (ask), on a particular security.

Appendix B: Performance Fees

KSM - 15.38% p.a. (incl. GST & RITC) of the amount by which the NAV exceeds the high-watermark. The Fund must also exceed a net 6% p.a. hurdle before a performance fees applies on total performance.

IMPQ - 20% of the Trust's net return in excess of the S&P/ASX Small Ordinaries Accumulation Index.

SMLL - A performance fee of 15.5% (inclusive of GST less reduced input tax credits) of the outperformance of the Fund may be paid to the Responsible Entity, based on the Fund's total return over the performance benchmark (the S&P/ASX Small Ordinaries Accumulation Index) in a calendar quarter.

PAXX - 15% of outperformance over benchmark (MSCI AC Asia ex-Japan Net Index (A\$)).

AGX1 - 15% of net return in excess of MSCI All Country World Net Index in AUD, net of the management fee.

MGOC - 10% of excess return over the higher of the MSCI World Net Total Return Index (AUD) and the yield of 10 year Australian Government Bonds, subject to a high-watermark.

MHG - 10% of excess return over the higher of the MSCI World Net Total Return Index (hedged to AUD) and the yield of 10 year Australian Government Bonds, subject to a high-watermark.

MOGL - 15.38% of the total return of the Fund after management fees and expenses have been deducted, that is in excess of the MSCI World Net Total Return Index (AUD), subject to a high-watermark.

PIXX - 15% of outperformance over MSCI AC World Net Index (A\$), subject to a high-watermark.

WCMQ - 10% excess return above the MSCI All Country World Index ex-Australia after Management Fee.

MICH - 10% of excess return over the higher of the S&P Global Infrastructure Index A\$ Hedged Net Total Return and the yield of 10 year Australian Government Bonds, subject to a high-watermark.

HBRD - 15.5% of outperformance above the Solactive Australian Hybrid Securities Index.

MKAX - 20% of the outperformance of 7% p.a. in any Performance Fee Calculation Period. The Hurdle is the greater of the high-watermark and the NAV per unit at the beginning of any Performance Fee Calculation Period.

MAET - 10% of the increase in the NAV during each Performance Fee Period, subject to exceeding a high-watermark and Hurdle Rate. The Hurdle Rate is the 10 year Australian Government Bond Yield + 3.5% p.a.

LPGD - 15% of excess return above the MSCI All Countries World Net Total Return Index (AUD) in any calculation period, subject to a high-watermark.

MSUF - 10% of excess return over the higher of the MSCI World Net Total Return Index (AUD) and the yield of 10 year Australian Government Bonds, subject to a high-watermark.

SHYF - 20% of excess return above the RBA Overnight Cash Rate + 1.50% in any calculation period, subject to a high-watermark.

HYGG - 20% excess return above the MSCI World Accumulation Index (AUD) (net of Management Fees), subject to a high-watermark.

MAAT - 20.5% p.a. of the amount by which the NAV per unit exceeds the high-watermark when the Fund achieves the RBA Cash Rate + 5% Hurdle.

FIXD - 20.5% excess return above the Bloomberg AusBond Composite 0+Yr Index (net of Management Fees), subject to a high-watermark.

GCAP - 15.5% excess return above the Hurdle Rate of RBA Cash Rate + 3% p.a., subject to a high-watermark.

MHHT - 10% excess return above the 10% p.a. Absolute Return Performance Hurdle, subject to a high-watermark.

GIVE - 15% excess return above the S&P/ASX 300 Accumulation Index, subject to a high-watermark.

IDEA - 20% excess return above the MSCI All Countries World Net Total Return Index (A\$), subject to a high-watermark.

FATP - 20% of the increase in the NAV during each Performance Fee Period, subject to exceeding a high-watermark.

MCGG - 10% of the Excess Return per Unit for the relevant Calculation Period (the six months to 31 March and 30 September each year), subject to a high-watermark and when outperforms the higher of MSCI World (Ex-Australia) Index (Net) (A\$) and 10 year Australian Government Bond Yield.

RCAP - 20% excess return above the FTSE/EPRA NAREIT Developed Index (AUD Hedged) Net TRI, subject to a high-watermark.

AEAE - 15% excess return (net of management fees and excluding any accrued performance fee) above the benchmark is the S&P/ASX 300 Accumulation Index, subject to a high-watermark.

Please refer to the relevant Product Disclosure Statement (PDS) for full disclosure of the fees and additional costs that may be incurred in the management of the ETF.

Appendix C: How an ETF operates

ETFs are open ended securities that trade on an exchange. Open ended denotes that new products can be created and redeemed on the Primary Market, without the requirement to release a new prospectus, ad infinitum. The open ended nature of ETFs is unique to this product class, and what keeps the underlying Net Asset Value (NAV) in line with the assets' market price. This process is managed by the Authorised Participants and Market Makers who are engaged by the ETF operator to continually create and redeem shares to ensure the discount to NAV is managed within a defined range.

This results in a two tiered market structure: The Primary Market and the Secondary Market. The Primary Market is the market in which Market Makers, via the Authorised Participants, are able to create and redeem units. The Secondary Market is the market in which investors are able to buy and sell these units on an exchange.

Mechanics of the Primary Market

The Authorised Participant applies to the issuer to create new ETF units via creation units. In return for each creation unit, the Authorised Participant will deliver a basket of securities that has been specified by the Issuer. This basket will be transferred and held by a Custodian. Following settlement, the Authorised Participant has an inventory of ETF securities (shares) that can be accessed by the Market Makers and sold on the ASX in the Secondary Market.

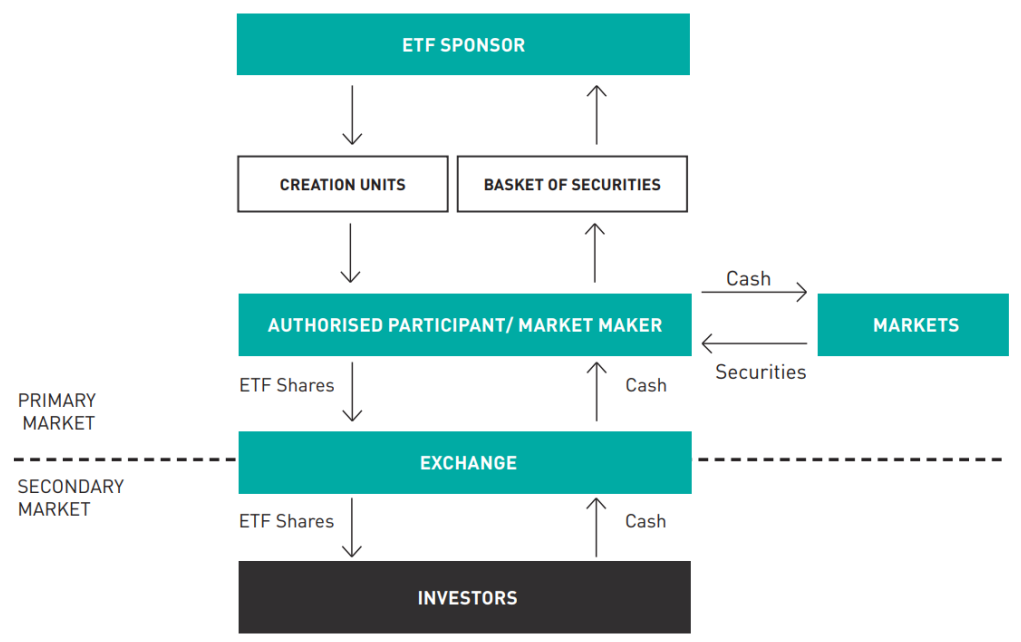

The redemption process operates in a similar manner. The Authorised Participant applies to redeem the securities in creation units. In return for each creation unit, the Authorised Participant will receive a basket of securities in kind. Each ETF security effectively represents a sliver of a creation unit.

Mechanics of the Secondary Market

The Secondary Market is the market in which investors are able to buy and sell ETF units with the assistance of the Market Maker. The Market Maker will access the Authorised Participants (Primary Market) if additional inventory is required (create) or alternatively sold (redeem), to in effect make the market. Hence, the liquidity of the ETF is as liquid as the underlying market.

The Market Maker effectively ensures liquidity in the market place by quoting Buy and Sell prices during the trading day. These prices are continuously updated to reflect the underlying changes in the securities. The ETF Issuer generally has a formal arrangement with at least one Market Maker with a mandate to make the market within a specified range of spread. However, in dislocated markets, Market Makers can suspend operations until the market stabilises.
